

2009 Portland GSA Annual Meeting (18-21 October 2009)

Paper No. 176-2

Presentation Time: 9:00 AM-6:00 PM

DEPTH EVOLUTION OF FRACTURED ROCK PERMEABILITY IN SHALLOW CRYSTALLINE FRACTURED ROCK AQUIFERS

BOUTT, David F., Department of Geosciences, University of Massachusetts, Morrill Science Center, 611 North Pleasant Street, Amherst, MA 01003, dboutt@geo.umass.edu

Fluid movement and availability in crystalline and heavily metamorphosed rocks is dominated by the secondary porosity generated through fracturing. The distributions of fractures and fracture zones determine permeable pathways and the overall productiveness of these rocks as aquifers. Fractured bedrock in many parts of the world are now being used as sources of water for both drinking and industrial uses. Understanding the sustainability and dynamics of these aquifer systems is crucial for future planning and regulating their use. In this presentation I present the results of a subsurface study of such a region experiencing expanded use of fractured bedrock for aquifers. This field-based study visited 17 wells and logged the distribution of fractures, identified flowing fractures, and hydraulically characterized the rock mass intersecting the borehole. Wells with total depths ranging from 30m to 300m showed trends of decreasing fracture frequency with depth, with hydraulically active fractures showing a similar trend. Of all the fractures encountered, only 4 were deemed to be hydraulically active. Decreases in the number of hydraulically active with depth would have the effect of restricting topographically drive flow systems to near surface regions. Observations of borehole temperature profiles suggest that this is indeed the case with little effects of hydrologically altered profiles below 100m. Mechanisms responsible for permeability alteration include: stress related fracture aperture reduction, reduced frequency of unloading related features, reduction in total fractures creating lower connectivity. Results from this study suggest that active flow systems in these geologic settings are shallow and that fracture permeability outside of the influence of large-scale structures should generally follow a quantifiable decreasing trend with depth.

of California

EXPLANATION

Sedimentary and Volcanic Rocks

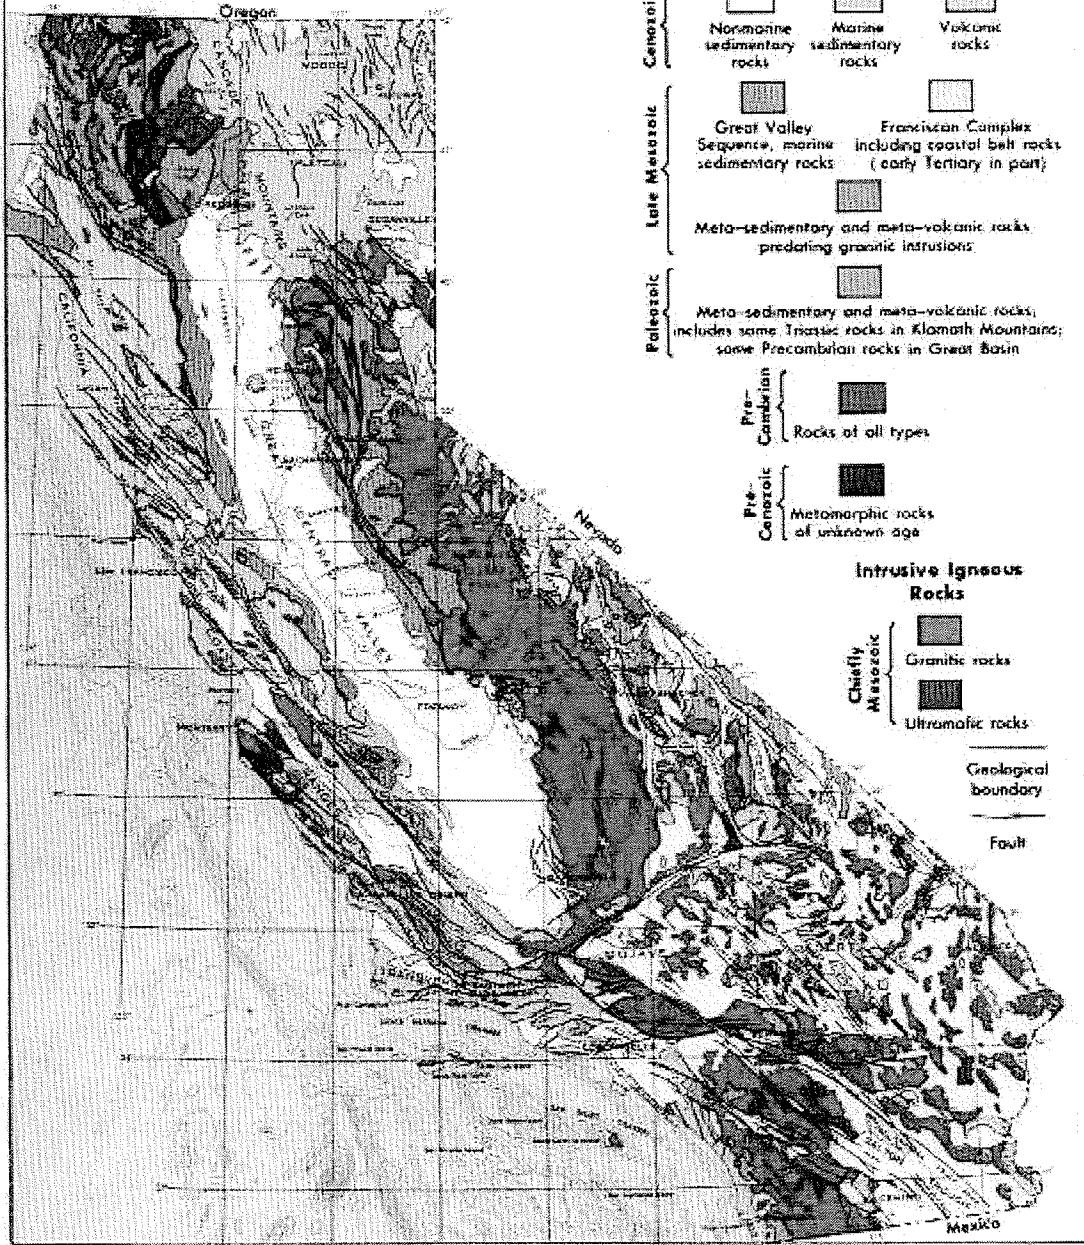

- | | | |
|----------|--|-----------------------------|
| Cenozoic | | Nonmarine sedimentary rocks |
| | | Marine sedimentary rocks |
| | | Volcanic rocks |
- | | | |
|---------------|--|--|
| Late Mesozoic | | Great Valley Sequence, marine sedimentary rocks |
| | | Franciscan Complex including coastal belt rocks (early Tertiary in part) |
- | | | |
|-----------|--|--|
| Paleozoic | | Meta-sedimentary and meta-volcanic rocks predating granitic intrusions |
| | | Meta-sedimentary and meta-volcanic rocks; includes some Triassic rocks in Klamath Mountains; some Precambrian rocks in Great Basin |
- | | | |
|--------------|--|----------------------------------|
| Pre-Cambrian | | Rocks of all types |
| | | Metamorphic rocks of unknown age |

Intrusive Igneous Rocks

- | | | |
|------------------|--|------------------|
| Chiefly Mesozoic | | Granitic rocks |
| | | Ultramafic rocks |

Fault

Geologic Controls on Groundwater in California

Where Groundwater Occurs

The Pressing Questions...

- ◆ Where are water bearing fractures located?
 - “Where should we drill?”
- ◆ What is the sustainable yield of fractured rock aquifers?
 - “How many wells should we allow?”

**Requires Multidisciplinary,
Integrated Approach**

Hydrogeology, Geology, Chemistry
With Good Baseline Data

Contrasting Scales of Interest

Porous Media

- ◆ $K(\vec{x})$, $S_s(\vec{x})$ continuous
- ◆ @ scale of stratigraphic units

Fractured Media

- ◆ $T(\vec{x})$, $S(\vec{x})$ discontinuous
- ◆ $T(\vec{x})$ @ discrete fractures
- ◆ $S(\vec{x})$ @ geologic units

Topo driven flow

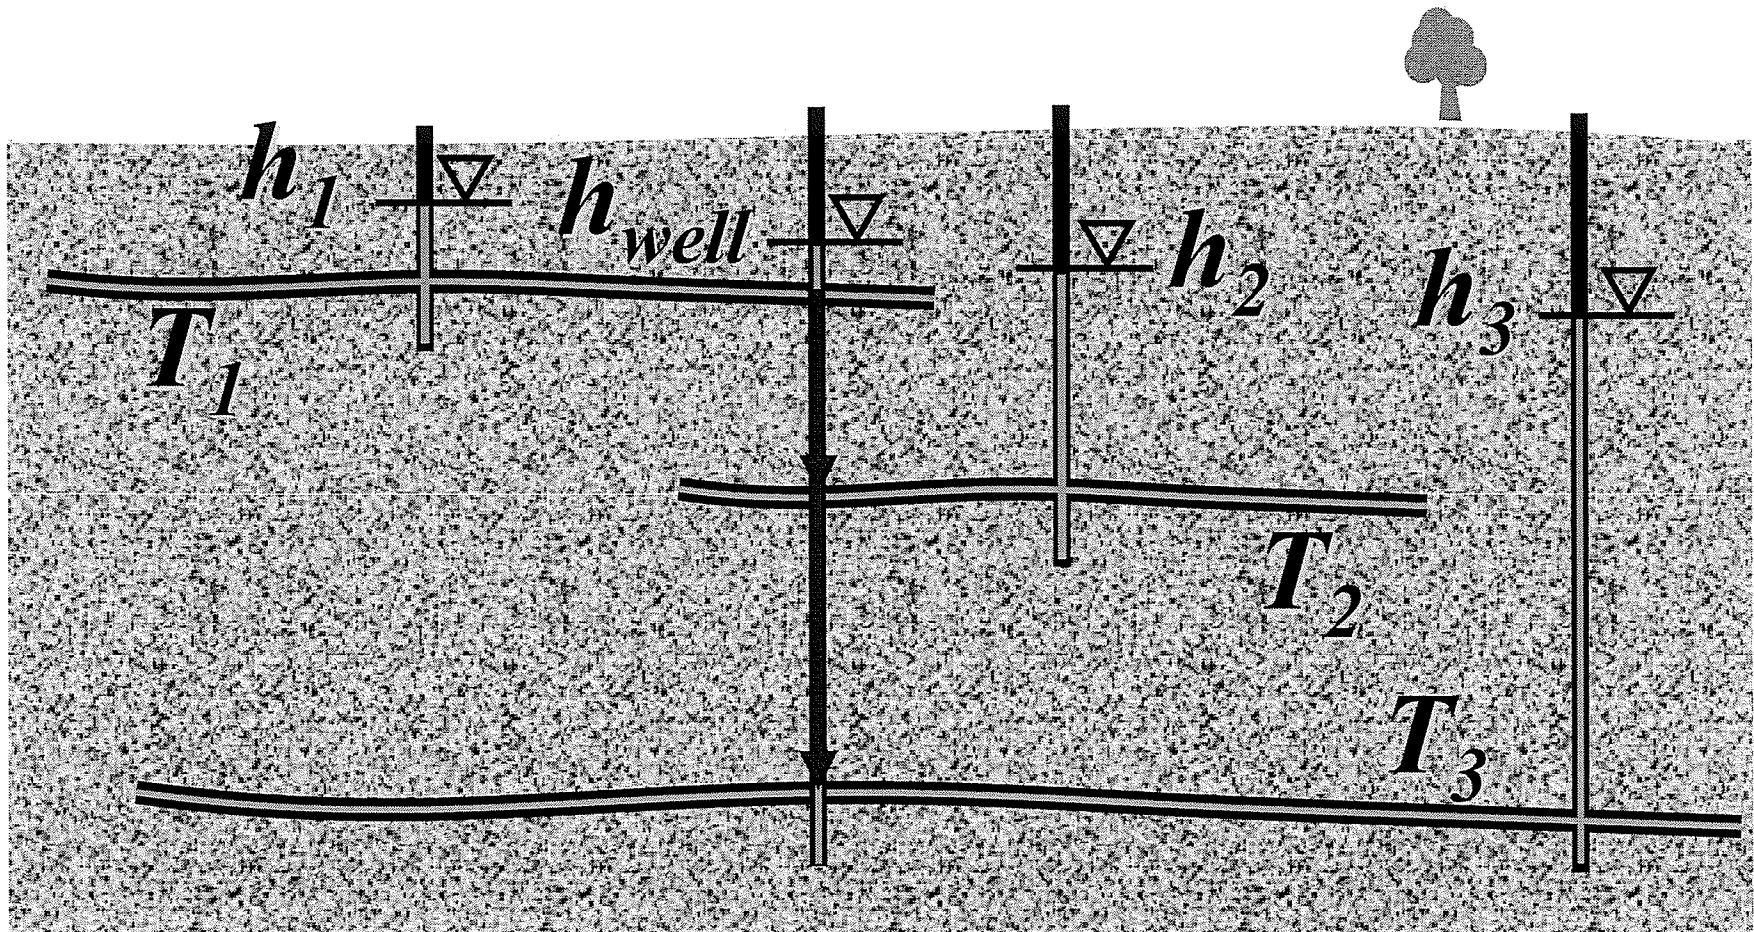

Static head in an open well

$$h_{WELL} \approx \frac{1}{n} \sum h_i$$

Flow in an open well

Flow during pumping

Recharge Variables

- ◆ Precipitation
- ◆ Snow melt
- ◆ Slope & Aspect
- ◆ Vegetation
- ◆ Overburden thickness
- ◆ Interflow

Subsurface Stormflow (Interflow)

- ◆ Controlled by bedrock topography
- ◆ Direction is independent of groundwater flow
- ◆ Intermittently saturated

The Pressing Questions...

- ◆ Where are water bearing fractures located?
 - “Where should we drill?”
- ◆ What is the sustainable yield of fractured rock aquifers?
 - “How many wells should we allow?”

Requires Multidisciplinary, Integrated
Approach

Hydrogeology, Geology, Chemistry

Detailed Well Inventories

- ◆ Location (GPS)
- ◆ Elevation
- ◆ Total Depth
- ◆ **Depth to Water-Bearing Fractures**
- ◆ **Overburden Thickness**
- ◆ **Total Yield**
- ◆ **Yield of Water-Bearing Fractures**
- ◆ **Water Quality** (Conductivity & Temperature)

Fracture Depth Distribution

- ◆ Probability of encountering a water-bearing fracture with depth

Water Quality Data

- ◆ Major Element Chemistry
 - Source Rock & Water-rock Interaction

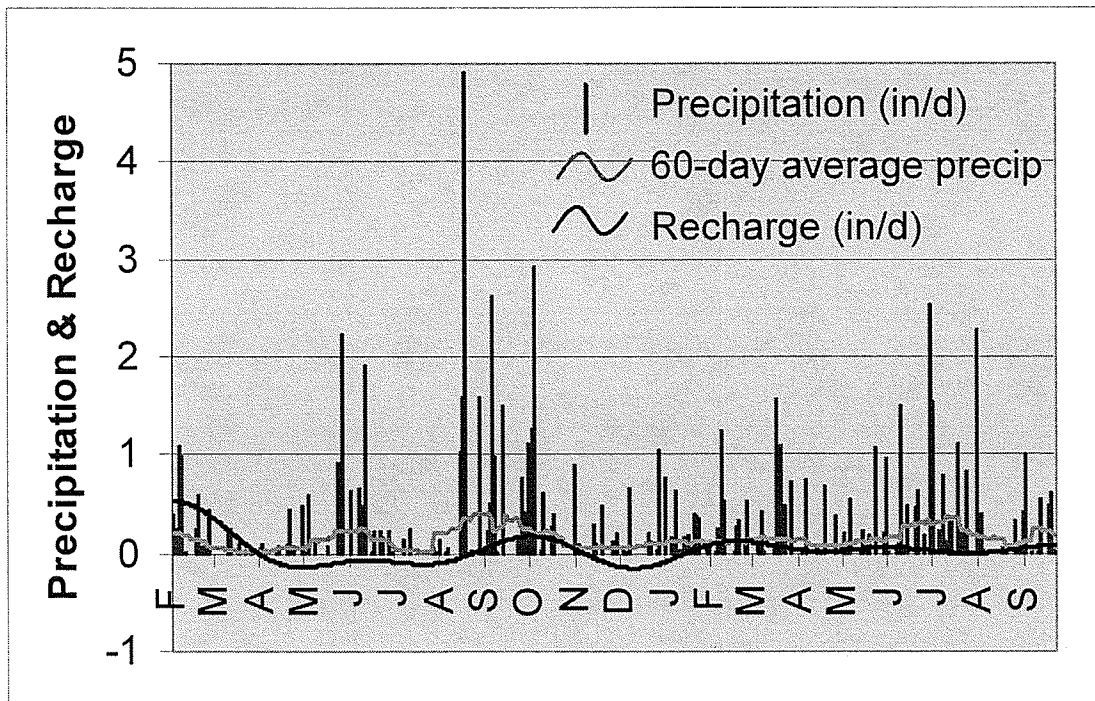

Water Quality Data

- ◆ Trace Element & Isotopic Chemistry
 - Source Identification
 - Flow Path Analysis

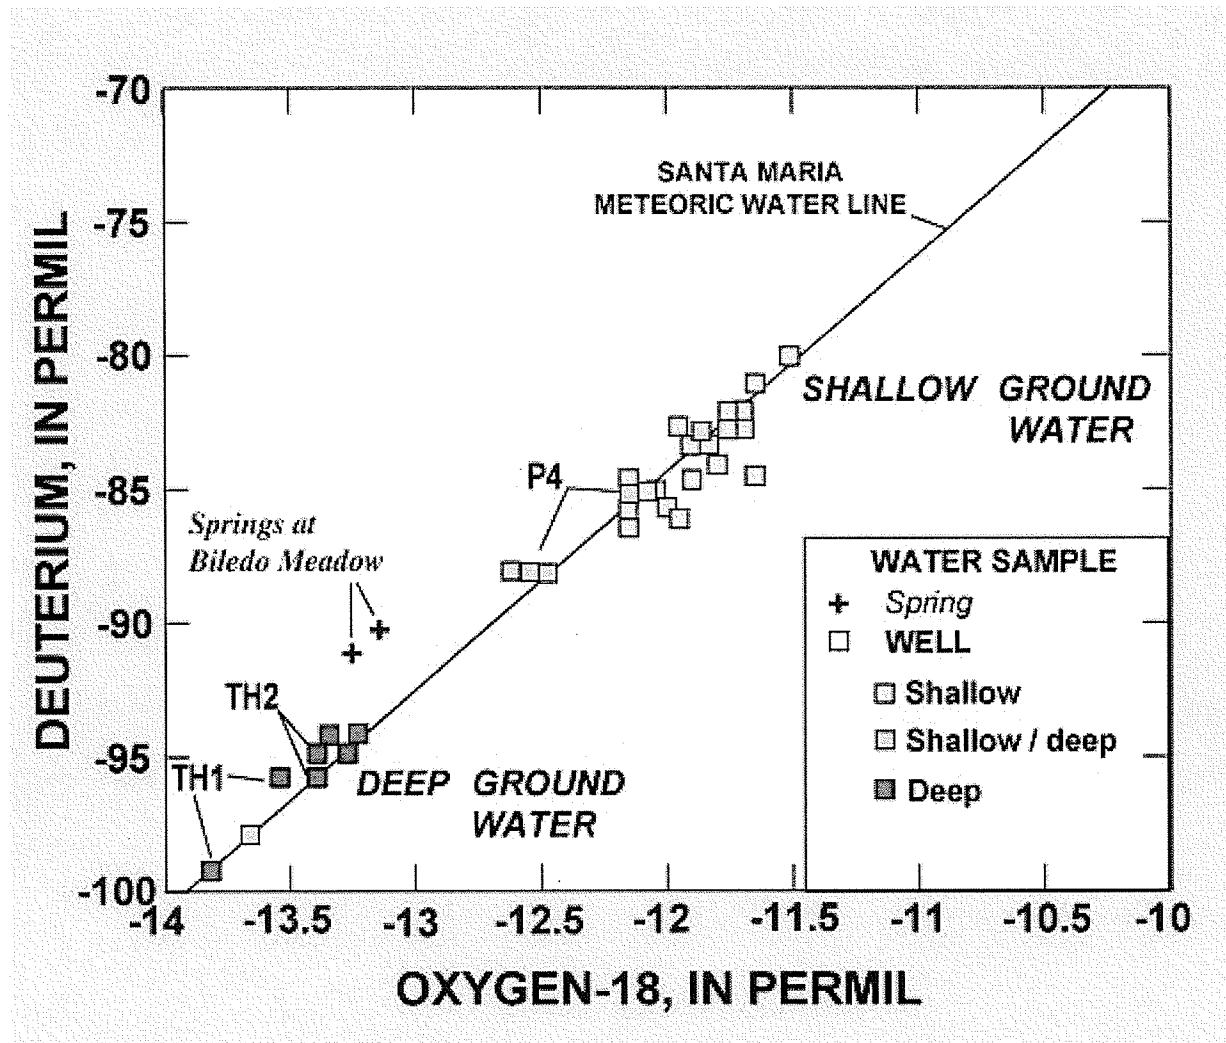

Monitoring Seasonal Variations...

◆ ... in Water Levels

Monitoring Seasonal Variations...

◆ ... in Water Quality

Locate Hydraulic Conductive Fractures

Test & Sample Discrete Fractures

◆ Packer Tests

- Isolate interval of borehole for hydraulic testing

Measure Interconnections Between Fractures

- Not Pumped
- Pumped

Multiple-well Flow Inference Tests

The Pressing Questions...

- ◆ Where are water bearing fractures located?
 - “Where should we drill?”

- ◆ Use the Geology
- ◆ Use the Regional Hydrology
- ◆ Determine Likely Recharge Areas
- ◆ Expect Large Uncertainties

The Pressing Questions...

- ◆ What is the sustainable yield of fractured rock aquifers?
 - “How many wells should we allow?”

- ◆ Determine General Pathways
 - Fracture Patterns
 - Fracture Properties
 - Geochemistry

- ◆ Conduct Systematic Monitoring
 - We have not even started.
